Criteria	Poor (1)	Inadequate (2)	Satisfactory (3)	Good (4)	Excellent (5)	Weight (%)
1. Implementation Accuracy and System Functionality	Code not functional or missing.	Partially working system with major flaws.	Fully functional basic version.	Reliable implementation with minor issues.	Fully optimized, stable, and efficient system with correct logic and operation.	**20%**
2. Application of Computer Architecture Concepts (Integration of Course Domains)	No link to syllabus concepts.	Weak or partial coverage of domains.	Covers most domains but with limited depth.	Clear application of architecture, memory, and parallelism.	Deep and seamless integration of **ISA, memory, pipeline, ILP, and TLP** in the system design.	**20%**
3. Analytical Evaluation and Performance Measurement (C4)	No analysis or justification.	Minimal qualitative discussion only.	Basic quantitative analysis (e.g., timing).	Clear analysis with metrics and comparisons.	Detailed quantitative evaluation (e.g., CPI, cache hit rate, latency, parallel speedup) with insightful discussion.	**20%**
4. System Complexity and Creativity	Very simple or copied idea.	Low originality or difficulty.	Moderate complexity, predictable idea.	Complex or creative design with good technical depth.	Highly innovative system with significant technical challenge and novel problem-solving approach.	**20%**
5. Documentation Quality (Structure, Clarity, and Technical Communication)	Disorganized and incomplete.	Lacks clarity and visual aids.	Structured and readable but limited detail.	Clear and well-organized, technically sound writing.	Professionally written report with excellent visuals, logical flow, and technical precision.	**20%**
